RADIATION THERAPY FOR LYMPHOMA:

A Comprehensive Overview

Lymphoma is a type of cancer that affects the lymphatic system, which is a key part of the immune system. Radiation therapy is a common treatment option for lymphoma, and it has several benefits for patients. In this report, we will explore the advantages of radiation therapy for lymphoma.

ADVANTAGES OF RADIATION THERAPY:

- Radiation therapy can be used to kill cancer cells in a specific area of the body. This is especially helpful in cases where the cancer is localized, or in combination with other treatments like chemotherapy. Radiation therapy can reduce the size of tumors, alleviate symptoms, and improve overall quality of life.
- Radiation therapy can be used to prevent cancer from returning or spreading. In cases where the cancer has been removed or has gone into remission, radiation therapy can be used to kill any remaining cancer cells and prevent the cancer from coming back.
- Radiation therapy can be used to treat the symptoms of advanced lymphoma, such as pain, swelling, or breathing difficulties. This can help to reduce discomfort and improve overall quality of life.

EFFECTIVENESS OF RADIATION THERAPY:

- Radiation therapy is a well-established treatment option with a long track record of effectiveness in treating lymphoma.

SIDE EFFECTS:

- Radiation therapy typically only causes minor side effects, such as skin irritation or fatigue, compared to other treatment options like surgery and chemotherapy.

CONCLUSION:

Radiation therapy is a proven and effective treatment option for all types of lymphoma.

It can be used to target cancer cells in specific areas of the body, prevent the cancer from returning, and alleviate symptoms of advanced lymphoma. If you have been diagnosed with lymphoma, speak to your physician to see if radiation therapy is a good treatment option for you.

QUICK FACTS

4% of all cancers in the U.S.
Non-Hodgkin lymphoma (NHL) accounts for 4% of all cancers in the U.S.

Age 65+
NHL risk increases with age, and over half of the people diagnosed with the disease are 65 or older.

74% survival rate
The 5-year survival rate for patients with NHL is around 74%.
