## RADIATION THERAPY FOR OCULAR CANCER:

# A Comprehensive Overview

Radiation therapy is a common treatment option for ocular cancer, a type of cancer that affects the eye or the surrounding tissues. It is a type of cancer treatment that uses high-energy radiation to kill cancer cells and shrink tumors. In this report, we will explore the benefits of radiation therapy for ocular cancer.

### ADVANTAGES OF RADIATION THERAPY:

- One of the key benefits of radiation therapy for ocular cancer is that it is a highly targeted treatment option. This means that it can be directed specifically at the cancer cells, while sparing healthy cells in the surrounding tissue.
- Radiation therapy can also be used in combination with other treatments, such as surgery, to improve the overall effectiveness of the treatment plan. For example, radiation therapy can be used after surgery to destroy any remaining cancer cells and reduce the risk of recurrence.
- In addition to being an effective treatment option, radiation therapy can also be a less invasive option compared to surgery. This can be particularly beneficial for patients who may not be good candidates for surgery due to their age, overall health, or the location of the tumor.

### EFFECTIVENESS OF RADIATION THERAPY:

- Radiation therapy can be a highly effective treatment option for ocular cancer, with a success rate of up to 90%.

### SIDE EFFECTS:

- Radiation therapy typically only causes minor side effects, such as dry eyes, blurry vision, or redness or irritation in the treated area. However, these side effects are generally temporary and can be managed with medication or other supportive therapies.

### CONCLUSION:

Radiation therapy is a proven and effective treatment option for ocular cancer with a low risk of complications.

It offers many benefits such as high success rates, the potential for combination with other treatments, and less invasiveness compared to surgery. If you have been diagnosed with ocular cancer, speak to your physician to see if radiation therapy is a good treatment option for you.

### QUICK FACTS

**3,000**

Ocular cancer is rare. Only about 3,500 cases are diagnosed a year in the U.S.

**90%** success rate

Radiation therapy has a success rate of up to 90% for treating ocular cancer.

**80%** survival rate

The 5-year survival rate for people with ocular cancer is 80%.
