RADIATION THERAPY FOR STOMACH CANCER:

A Comprehensive Overview

Radiation therapy is a common treatment option for stomach cancer, also known as gastric cancer. It is a type of cancer treatment that uses high-energy radiation to kill cancer cells and shrink tumors. In this report, we will explore the benefits of radiation therapy for stomach cancer.

ADVANTAGES OF RADIATION THERAPY:

- One of the key benefits of radiation therapy for stomach cancer is that it can be directed specifically at the cancer cells, while sparing healthy cells in the surrounding tissue.
- Radiation therapy can be used in combination with other treatments, such as surgery and chemotherapy, to improve the overall effectiveness of the treatment plan. For example, radiation therapy can be used before surgery to shrink the tumor, making it easier to remove. It can also be used after surgery to destroy any remaining cancer cells and reduce the risk of recurrence.
- In addition to being an effective treatment option, radiation therapy can also be a less invasive option compared to surgery. This can be particularly beneficial for patients who may not be good candidates for surgery due to their age, overall health, or the location of the tumor.

EFFECTIVENESS OF RADIATION THERAPY:

- Radiation therapy is a well-established and highly effective treatment option for stomach cancer, with a success rate of up to 70%.

SIDE EFFECTS:

- Radiation therapy typically only causes minor side effects, such as nausea or fatigue. However, these side effects are generally temporary and can usually be managed with medication.

CONCLUSION:

Radiation therapy is a proven and effective treatment option for stomach cancer with a low risk of complications.

It offers many benefits such as high success rates, the potential for combination with other treatments, and less invasiveness compared to surgery. If you have been diagnosed with stomach cancer, speak to your physician to see if radiation therapy is a good treatment option for you.

QUICK FACTS

1.5%

Stomach cancer accounts for about 1.5% of all new cancers diagnosed in the U.S. each year.

40%

About 40% of people with stomach cancer receive radiation therapy as part of their treatment plan.

70% survival rate

Radiation therapy has a success rate of up to 70% for treating stomach cancer.
